Problem Session 6

02/20/2019

---

(1) Problem 5.14, Jackson.

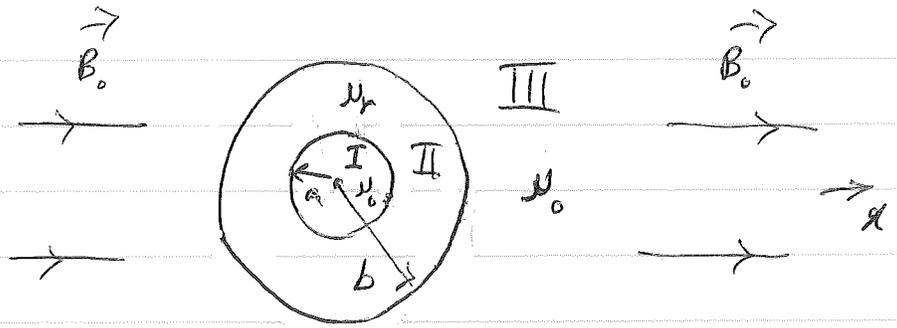

(2) Problem 5.19, part (a), Jackson.

(2)

(1) This problem is best suited by the means of the magnetic scalar potential as  $\vec{J} = 0$ .

In region III:

$$H_0 = \frac{B_0}{\mu_0} \Rightarrow \Phi_M^{(0)} = -H_0 \rho \cos\phi$$

Then:

$$\Phi_M^{\text{III}} = \Phi_M^{(0)} + \Phi_M^{\text{(induced)}} = -H_0 \rho \cos\phi + \frac{A}{\rho} \cos\phi$$

In region II:

$$\Phi_M^{\text{II}} = \left( \frac{B}{\rho} + C\rho \right) \cos\phi$$

Finally, in region I:

$$\Phi_M^{\text{I}} = D\rho \cos\phi$$

Using the continuity of  $H_t$  and  $B_n$  at  $r=b$  and  $r=a$  results in:

$$\Phi_M^{\text{I}}(a) = \Phi_M^{\text{II}}(a) \quad , \quad \Phi_M^{\text{II}}(b) = \Phi_M^{\text{III}}(b)$$

$$\mu_0 \frac{\partial \Phi_M^{\text{I}}}{\partial r}(r=a) = \mu_r \frac{\partial \Phi_M^{\text{II}}}{\partial r}(r=a) \quad , \quad \mu_r \frac{\partial \Phi_M^{\text{II}}}{\partial r}(r=b) = \mu_0 \frac{\partial \Phi_M^{\text{III}}}{\partial r}(r=b)$$

These will allow us to find  $A, B, C, D$ .

$$(2) \begin{cases} \vec{M} = M_0 \hat{z} & 0 \leq z \leq L, 0 \leq \rho \leq a \\ \vec{M} = 0 & \text{elsewhere} \end{cases}$$

This implies that:

$$\rho_M = \vec{\nabla} \cdot \vec{M} = 0, \quad \sigma_M = \vec{M} \cdot \hat{n} = \begin{cases} +M & z=L, 0 \leq \rho \leq a \\ -M & z=0, 0 \leq \rho \leq a \\ 0 & \text{elsewhere} \end{cases}$$

Then:

$$\Phi_M(\vec{x}) = \frac{1}{4\pi} \int \frac{\sigma_M da}{|\vec{x} - \vec{x}'|} = \frac{-M}{2\pi} \int_0^a \frac{2\pi \rho' d\rho'}{\sqrt{\rho'^2 + z^2}} + \frac{M}{2\pi} \int_0^a \frac{2\pi \rho' d\rho'}{\sqrt{\rho'^2 + (z-L)^2}}$$

Now:

$$\begin{aligned} \Phi_M(0,0,z) &= -\frac{M}{4} \int_0^a \frac{d(\rho'^2 + z^2)}{\sqrt{\rho'^2 + z^2}} + \frac{M}{4} \int_0^a \frac{d(\rho'^2 + (z-L)^2)}{\sqrt{\rho'^2 + (z-L)^2}} = \\ &= -\frac{M}{4} \left[ 2(\rho'^2 + z^2)^{\frac{1}{2}} - 2(\rho'^2 + (z-L)^2)^{\frac{1}{2}} \right] \Big|_0^a = -\frac{M}{2} \left[ \sqrt{a^2 + z^2} - |z| - \sqrt{a^2 + (z-L)^2} + |L-z| \right] \end{aligned}$$

From symmetry,  $\vec{H}$  and  $\vec{B}$  are along  $\hat{z}$  on the  $z$  axis. Thus:

$$\vec{H} = H_z \hat{z} = -\frac{\partial \Phi_M}{\partial z} \hat{z}$$

Inside,  $0 \leq z \leq L$ , we have (note that  $\vec{B} = \mu_0 (\vec{H} + \vec{M})$ ):

$$\vec{H} = \frac{M}{2} \left[ \frac{z}{\sqrt{a^2 + z^2}} - \frac{(L-z)}{\sqrt{a^2 + (L-z)^2}} - 2 \right], \quad \vec{B} = \mu_0 \frac{M}{2} \left[ \frac{z}{\sqrt{a^2 + z^2}} - \frac{L-z}{\sqrt{a^2 + (L-z)^2}} \right]$$

Outside,  $z > L$  or  $z < 0$ , we have:

$$\vec{H} = \frac{\vec{M}}{2} \left[ \frac{z}{\sqrt{a^2 + z^2}} - \frac{L-z}{\sqrt{a^2 + (L-z)^2}} \right], \quad \vec{B} = \frac{\mu_0 \vec{M}}{2} \left[ \frac{z}{\sqrt{a^2 + z^2}} - \frac{L-z}{\sqrt{a^2 + (L-z)^2}} \right]$$

We see that  $\vec{B}$  has the same expression both inside and outside.

This is not surprising as  $B_n$  is continuous at the interface between two media, and here  $\vec{B}$  is in the normal direction (i.e.,  $\hat{z}$ ) at the two faces of the cylinder.
